Timeline

0:00 **Recording Started** Recording Started

1:24 **Topic 1** A little “tell us about yourself” bit, like you do with your guests

6:33 **Topic 2** What prompted you to write it?

14:40 **Topic 4** The book has some neat non-standard features
The Audio Reader’s Briefs and the Galleries, gives a quick run down on what they are and why you included them.

19:58 **Topic 3** Made by humans
You’re a big AI proponent, yet you’ve got a “Made by Humans” logo, what made you decide to do this the old fashioned way?

28:50 **Topic 6** Why build it yourself?

30:54 **Topic 5** Talk Python’s technical journey

- One of the things I like about the book is that it covers Talk Python’s technical journey. A lot of content like this is very opinionated “this is best”, whereas you’ve shown how your approach has changed over time. You started out in Pyramid, right?

- **38:26** **Topic 8** Chapter 4 is titled, "Docker, Docker, Docker"
 - What's that one about?
 - Originally I wasn't for it, but then "one big server"
 - That needs more isolation for the long haul
 - Not into docker compose? Consider **Coolify for a Heroku-like self hosted experience**. <https://coolify.io>
- **49:25** **Topic 10** Heavy-weight docker?

A lot of people try to make their docker instances absolutely as minimal as possible. I kind of promote the alternative, adding all the tools that make your life easier. It might be fun to debate this.
- **54:05** **Topic 14** Picking a Python Web Framework

I think my favourite chapter was 13, titled "Picking a Python Web Framework". I liked the nuance of it. We often don't get to see people's reasoning behind things. I think there is real value in this chapter even if you're not planning on using the tech outline elsewhere. Understanding trade-offs is important.
- **67:55** **Topic 15** Similarly Chapter 15: Hetzner
 - Where you do a retrospective on choosing Hetzner your host provider.
- **84:15** **Interview Ended** Interview Ended
